

Website Developer Instructions

Hi, I'm looking to build a simple mobile-friendly website. Not a huge complicated app or anything over the top.

Main thing I need is a place where customers can login with email, access game/platform links, and message support directly outside of Facebook Messenger.

A few important things I need:

- Real-time messaging/chat system
- Customers and support should be able to send messages instantly
- Must support photo/image uploads inside chat smoothly
- Should feel fast and simple on mobile
- Clean modern design, not cluttered
- Option for users to add or save a direct phone number to their account/profile

Website structure:

Homepage:

- Logo/header
- Login/Register buttons
- Short intro section
- Mobile friendly layout

User accounts:

- Email + password signup/login
- Password reset
- Basic user dashboard after login
- Optional phone number field

Dashboard:

- Game/platform cards
- Download/login/access links
- Simple instructions section
- Support/chat button always accessible

Admin side:

- Add/edit/remove game links
- Manage users
- Disable users if needed
- Send announcements/notices
- Access customer chats/messages

For messaging:

I want something smooth like a real messaging app experience. Messages should appear instantly without refreshing. Must support image uploads and attachments properly. Mobile experience is very important.

Tech stack can be whatever you think is reliable and clean. Firebase/Supabase is fine. React/Next.js is fine too.

Another important thing:

I need full ownership/control of everything:

- Domain
- Hosting
- Database
- Source code
- Admin accounts
- Third-party services

Please do not host things under personal developer accounts long-term.

Also let me know:

- What stack you recommend
- Estimated timeline
- Estimated price
- What accounts I need to create myself
- How bug fixes/maintenance would work later on

Right now I only want a clean reliable website setup, not a giant custom platform or native mobile app.
